TECHNICAL SKILLS

Languages

PHP 8.3, Java, SQL, JavaScript

Frameworks

Laravel 10/11/12, ANTLR4

Authentication

JWT (stateless), Refresh Token Rotation, Laravel Sanctum, Google OAuth, Socialite

Databases

MySQL 8 (primary/replica replication, spatial indexing), Redis 7

Real-Time

WebSockets, Laravel Echo, Pusher, Laravel Ververb, Firebase FCM

Architecture

Repository, Strategy, Observer, SOLID, Clean Architecture, DTOs, Value Objects, Event/Listener

DevOps & Tools

Docker, Docker Compose, Nginx, GitHub Actions, Render.com, PM2, Laravel Horizon, Octane / RoadRunner

Cloud & Storage

AWS S3, Flysystem, Intervention Image, Nominatim / Mapbox Geocoding

Testing & Quality

PHPUnit, k6 (load testing), SonarQube, Postman, Swagger / OpenAPI

Reporting

Maatwebsite Excel, Laravel DomPDF, Spatie Activity Log

EDUCATION

B.Sc. Software Engineering

Damascus University
Faculty of IT Engineering
Graduated September 2026

CERTIFICATIONS

English Language Certificate

British Council
EF SET - C1 Advanced - 67/100

LANGUAGES

Arabic Native

English Proficient (Certified)

KEY HIGHLIGHTS

9,300+

Concurrent users validated (k6)

663+

Tests authored, ~65% coverage

50+

Documented API endpoints

6

Production-grade projects

Abdalrahman Alzoubi

BACKEND PHP DEVELOPER & SOFTWARE ENGINEER

[Portfolio](#)

PROFESSIONAL SUMMARY

Fresh Software Engineering graduate from Damascus University (September 2026) with 3+ years of hands-on backend development using PHP and Laravel. Built and delivered production-grade systems from scratch including a real-time carpooling platform validated at 9,300+ concurrent users under k6 load testing. Experienced in clean layered architecture, domain-driven design patterns (Repository, Strategy, Observer, Value Objects), MySQL primary/replica replication, Redis caching, Docker deployments, and CI/CD pipelines. Also built a full compiler pipeline in Java + ANTLR4 as a compiler-theory project. Seeking backend developer roles to contribute to scalable, high-throughput applications.

PROJECTS

Atareekak - Ride-Sharing & Carpooling Platform API GRADUATION CAPSTONE

Laravel 11 PHP 8.3 MySQL Replication Redis 7 Docker Nginx RoadRunner/Octane k6
GitHub Actions Render.com Firebase FCM WebSockets Google OAuth Mapbox/Nominatim
SonarQube

- Production-grade carpooling backend - full ride lifecycle: create → search → book → launch → complete/cancel
- Validated 9,300+ concurrent users under k6 load testing across 4 scenarios (no-cache/no-LB, cache, load-balanced, cache + load-balanced)
- Multi-channel OTP (SMS/WhatsApp/Email); JWT auth with token versioning plus refresh token rotation (separate user & staff tokens) for instant session invalidation
- Google OAuth (Socialite) alongside phone-based registration; national ID verification for trust & safety
- Document verification system - dedicated upload, review & approval pipeline (DocumentController + DocumentVerificationService) for national ID and driver documents
- Multi-gateway wallet (Cash, ePay, Wallet) via Strategy pattern with pluggable providers resolved by factory; cash-ride debt accumulation & settlement flow
- Wallet request approval flow - user-initiated deposit/withdrawal requests with typed enums (WalletRequestType, WalletRequestStatus) and admin approve/reject pipeline
- Trust score engine with 6 configurable Policy classes (RideCompletion, DriverNoShow, DriverCancelRide, DriverCancelSeat, PassengerCancel, PassengerNoShow), user tiers & cancel-rate tracking
- Dual reputation model - user-to-user ratings system (UserRating) kept separate from the policy-driven trust score engine
- Automated no-show resolution pipeline - scheduled command auto-resolves expired reports; system-generated ratings for confirmed no-shows
- Communication number masking on rides & bookings - privacy-protecting virtual numbers between drivers and passengers
- Arabic place-name geocoding layer (ArabicPlaceNameService) - localized RTL/Arabic address resolution for the MENA market on top of Nominatim/Mapbox geocoding
- MySQL primary/replica replication: writes to primary, reads distributed to replica; Redis + Horizon for caching and queues
- Real-time in-ride chat + Firebase FCM push notifications; Laravel Echo WebSocket broadcasting
- Staff portal: multi-role employees, complaint management, review moderation, ban system, CSV exports
- 50+ documented API endpoints (OpenAPI/Swagger); CI/CD via GitHub Actions; static analysis via SonarQube
- Multi-target deployment - Docker Compose/Nginx on VPS plus Render.com (render.yaml) for cloud environments
- Patterns: Repository, Strategy, Observer, DTO, Value Objects (Money, Location, PhoneNumber, Email), Event/Listener async bus

PHPUnit Laravel Feature & Unit Testing MySQL Spatial JWT Middleware

Testing & QA: ~65% codebase coverage, 663+ tests across 100+ test classes

TESTING CONTRIBUTION

- Authored a comprehensive PHPUnit suite spanning Feature (HTTP/API contract) and Unit (service, model, domain) layers, covering all major domains: authentication, bookings, payments, rides, documents, complaints, staff operations, notifications
- Integration tests for complex financial flows: wallet-to-wallet transfers, time-based refund tiers (0-30/30-50/50-70/70-100% elapsed → 100/70/50/0% refund), escrow release on ride completion

ADDITIONAL INFORMATION

- Strong academic foundation with 3+ years delivering production-grade backend systems independently
- Designed RBAC across multiple projects - dual-role JWT separation (user vs. staff) in Atareekak to three-role RBAC in e-commerce
- Consistent track record of secure wallet/payment systems: escrow (WorkBridge), multi-gateway strategy with cash-debt settlement (Atareekak), inventory-aware pricing (e-commerce)
- File upload/download pipelines across projects - S3-backed cloud storage with image processing to local deliverable files in freelance requests
- Proficient in AI-assisted development and prompt engineering for enhanced productivity and problem-solving
- Self-motivated: all six portfolio projects built without formal employment, driven by personal initiative
- Passionate about scalable backend architecture, high-throughput system design, and maintainable code
- Available for full-time backend developer positions; open to remote and on-site roles

- Validated dual-auth middleware (JwtAuthMiddleware, StaffJwtMiddleware) across all token lifecycle states: missing, invalid, revoked, version-invalidated, wrong type (refresh used as access), banned/inactive account
- Covered RBAC for a three-tier staff hierarchy (support_agent → admin → system_admin) and two admin identities (system_admin / sycash), asserting correct 200/401/403 per role and route
- Tested spatial MySQL queries (raw ST_GeomFromText with SRID 4326) to avoid Cartesian SRS errors and validate proximity-based ride search
- Applied Storage::fake, Http::fake, Event::fake, and Log::shouldReceive to isolate external dependencies (FCM, Nominatim, Mapbox, Google OAuth) without network calls
- Ensured idempotency on booking creation and OTP flows - duplicate requests return the same resource rather than creating duplicates
- 100% branch coverage on pure domain logic (Money, Location, PhoneNumber, ScoreResult, RefundResult, PaymentResult) via PHPUnit directly, no Laravel bootstrap overhead

WorkBridge - Job Recruitment & Freelance Marketplace API

Laravel 10 PHP 8.1 JWT Google OAuth (Socialite) Pusher Redis MySQL PHPUnit 10

- Dual-purpose platform: job recruitment (post → apply → hire) + freelance marketplace (post → request → deliver → pay)
- Admin-mediated escrow wallet with 5% platform fee; cash-in flow for markets with limited payment infrastructure
- JWT stateless auth + Google OAuth with token blacklisting on logout; 3-role system across 22 database tables
- Real-time notifications via Pusher; category-based recommendation matching profiles to offers without ML overhead
- Service lifecycle: waiting → accepted (escrow deducted) → delivered (funds released) → rejected
- Phone validation with libphonenumber; file upload/download system for project deliverables

Multi-Vendor E-Commerce Marketplace API

Laravel 11 PHP 8.2 Sanctum Laravel Reverb (WebSockets) MySQL PHPUnit 11

- Multi-vendor REST API supporting Customers, Store Owners, and Admins with Sanctum token authentication
- Full order lifecycle with automatic inventory adjustment on create/update/delete; dynamic pricing recalculation
- Shopping cart and favorites scoped per store; real-time event broadcasting via Laravel Reverb
- Admin panel to provision stores and products across all vendors; role-gated middleware on every endpoint

Internet Programs - Full-Stack Laravel Web Application

Laravel 12 PHP 8.2 JWT + Sanctum AWS S3 Tailwind CSS v4 Vite 7 PM2

- Dual authentication (JWT + Sanctum session), Google OAuth, full audit trail via Spatie Activity Log
- AWS S3 cloud storage with Intervention Image processing; Excel (Maatwebsite) and PDF (DomPDF) export
- PM2 multi-instance deployment with 4 parallel PHP workers (ports 8000-8003) behind Nginx
- Transactional email via MailerSend; queue-backed jobs for non-blocking delivery

Smart Mobile Hospital - Odoo ERP System

Python XML Odoo 17 ERP IoT CRM Point of Sale

- Full-Stack ERP Customization: built a custom Python/XML Odoo module ("Project Pulse") to automate emergency medical triage based on real-time simulated IoT vitals
- Security Architecture: designed a multi-tier Access Rights matrix enforcing Segregation of Duties (SOD) across 8+ functional roles in a Smart Mobile Hospital environment
- Logistics Engineering: configured decentralized inventory and fleet management for mobile medical units - 3-way matching and Lot/Batch expiration tracking
- Disaster Resilience: repurposed CRM and PoS engines to build internet-independent tele-triage and medication dispensary systems for disconnected disaster zones

AngularScript - Compiler

Java ANTLR4 Visitor Pattern Compiler Theory

- Full pipeline: Lexer (ANTLR4) → Parser → AST → Semantic analysis → Code generation
- Translates Angular-inspired component language to vanilla HTML/CSS/JS
- 18 typed AST node classes; 9 scoped symbol tables; 10 distinct semantic error types with multi-pass error reporting
- Detects: duplicate declarations, undefined variables, return type mismatches, void method violations, binding errors
